FOR INVESTORS WHO MANAGE STOCKS & OPTIONS

See what your stock and options trades actually earned.

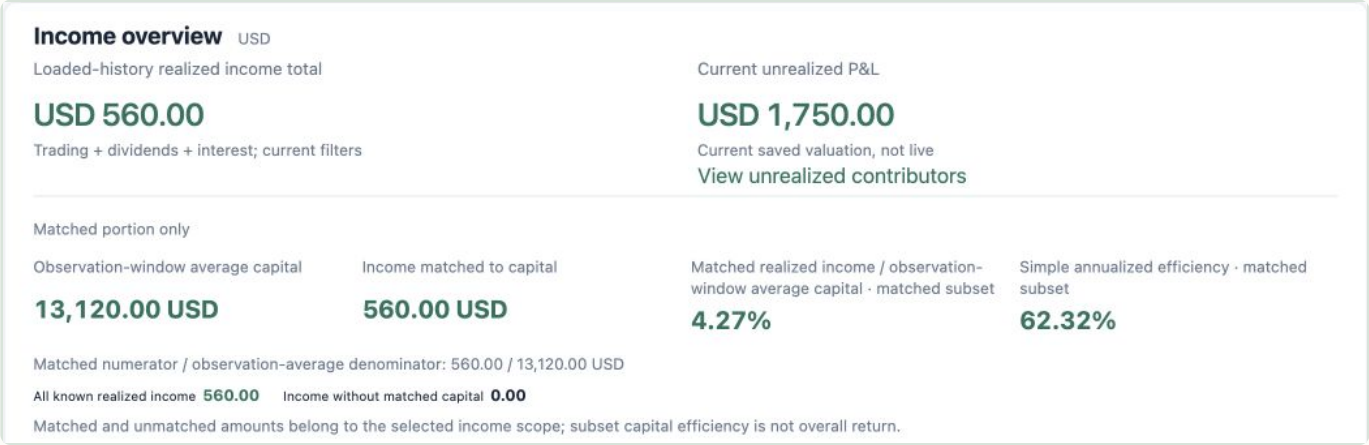

Your broker lists transactions and positions. TAD connects related records so you can review gains, losses and capital use across accounts, stocks and strategies.

Your broker data stays on your computer.

Import, save and analyze locally. The current TAD app does not upload your broker files or account data to a TAD cloud service.

The interface's Upload action sends files to the app on your computer. Information you choose to share through feedback, email or another service is a separate action.

Download the Mac technical preview or request a demo.

Current public app, wholly synthetic accounts. USD 560 known realized income and USD 1,750 saved unrealized P/L. Capital rates apply only to the matched realized subset, not account return. Saved date: 2026-10-26.

STRATEGIES

What contributed to P/L?

EACH STOCK

How do the trades add up?

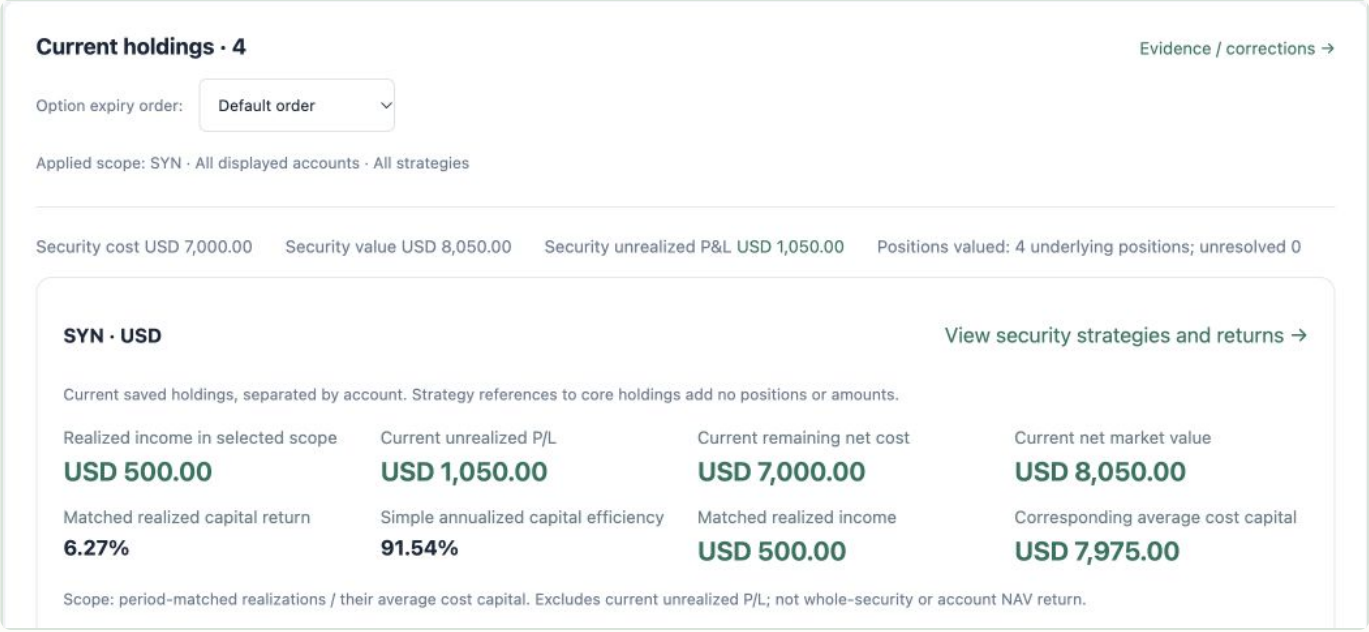

CAPITAL

How much, and for how long?

STRATEGIES + INDIVIDUAL STOCKS

Find the contributors. Then follow the trades.

Start with the result that matters to you. Compare strategy contributions or bring a stock and its related options into one review.

SYN security summary, wholly synthetic: USD 500 realized and USD 1,050 saved unrealized P/L across stock and options. Displayed return metrics use matched realizations, excluding current unrealized P/L; they are not a whole-security or account return. Trade details continue below this cropped view.

By strategy

Compare stock and option contributions, including supported LEAPS and CC. Explore PMCC support through long-Call and short-Call records. Confirmed relationships and complete strategy returns depend on the available evidence.

By stock

Bring stock transactions and related options together. Find open holdings and closed trades, then inspect the gains, losses and costs behind each result.

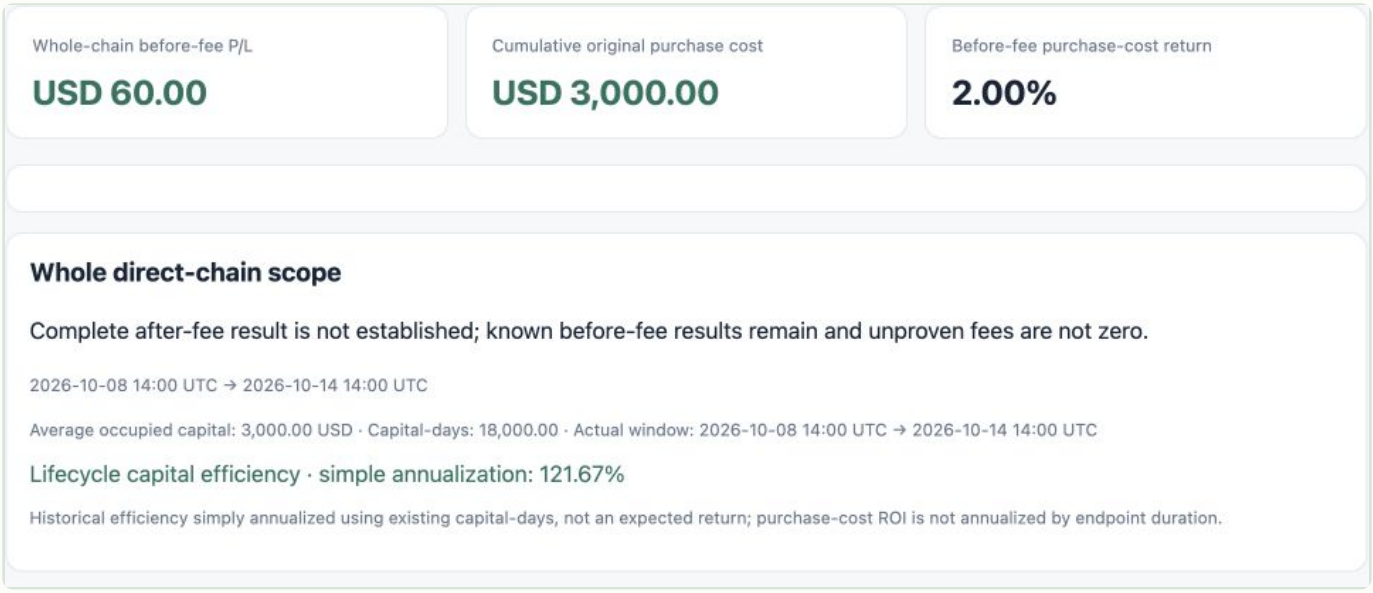

A call premium is only part of the story.

A stock or long Call can lose more than the short Call earns. Read the supporting asset alongside the short leg; some strategy results remain partial. TAD marks those gaps beside the analysis.

THE TRADE BEHIND THE NUMBER

Follow each trade, from entry onward.

Follow open, partly closed and closed trades. See recorded entry costs, dates, remaining holdings and realized results where the records support them.

CLOSE, a wholly synthetic completed stock trade: USD 3,000 purchase cost, USD 60 before-fee profit, 2.00% before-fee return, held 6 calendar days. Complete after-fee results are not established; this is not account return or a performance promise.

01 Profit and loss

Separate realized results from unrealized P/L at the displayed saved price and date. Prices are saved observations, not live quotes.

02 Return on the trade

Check the included legs, period and cost basis. A whole-trade return needs a complete lifecycle and sufficient cost evidence.

03 Capital and time

Check which trades and dates each capital-use or efficiency figure covers. A matched subset is not an account return, and short-Call income is not the complete CC or PMCC return.

TRY THE PUBLIC TECHNICAL PREVIEW

Bring your questions. Start with the samples.

Download the Mac preview with synthetic broker files and bilingual guides. No Git, Python, Node, model account or API key is required. You can also request a demo.

Kit 1.1.0-alpha.1 / App 1.1.0-tester-review.1

Broker files, with a defined scope

Specific USD CSV layouts from Moomoo, Chase / J.P. Morgan investment accounts and E*TRADE. Compatibility depends on the report and available history. Ordinary statement upload archives PDFs; it does not extract or reconcile their contents.

Mac preview, not yet broadly verified

Planned: Apple Silicon M1+ and release macOS 15 / 26 / 27. Verified: development Mac on macOS 15.2, including independent same-Mac review. Test-user Macs remain unverified. Ad-hoc signed; NOT notarized. Do not disable system protections to run it.

Begin with synthetic samples. After those checks pass, use the online guide for optional personal-data evaluation in a separate fresh environment. Keep account details and broker originals out of public feedback.

Not yet available: Windows, a generic import template, general PDF extraction, live quotes or knowledge-based trade-management guidance.

A working product. An AI development case study.

Product & financial logic

Designed stock and options review workflows covering strategy contributions, per-stock P&L, trading costs, and capital efficiency.

Data architecture & curation

Designed extensible, layered data models with user review and traceable corrections to improve data quality and support additional brokers and analyses.

AI-native development

Built and iterated the application, coordinating specialized AI agents for implementation, code review, testing, and release.
